

Marion Delaunay, PhD

Marion earned her Bachelor of Science in Biology from the University of Tours and her Master of Science in Molecular and Cellular Biology from the University of Lyon, both in France. For her master's thesis, she studied the directed manipulation of postnatal brain germinal activity with bioactive small molecules at the Stem Cell and Brain Research Institute in Lyon. In 2018, she joined Prof. Dario Diviani's group as a Ph.D. student in Lausanne, Switzerland. There, she investigated the role of A-kinase anchoring proteins in stress-induced cardiac fibrosis. After obtaining her Ph.D., she joined Timothy McKinsey's lab in Denver, Colorado, where she currently investigates the role of epigenetics in regulating pathological cardiac hypertrophy and fibrosis associated with heart failure.
